## 1. Introduction

DRU, a manufacturer of gas-fired heating appliances, develops and produces products that comply with the highest possible quality, performance and safety requirements. This appliance has a CE label, which means that it complies with the essential requirements of the European Gas Appliance Directive. The appliance is supplied with an installation manual and a user manual. The appliance may only be installed by recognised installers who are skilled in the field of gas heating and electricity. The information in this installation manual will ensure the appliance is installed in such a way that it will function properly and safely.

This manual discusses the installation of the appliance and the regulations that apply to the installation. In addition, the appliance's technical data are shown and information is provided about maintenance, possible malfunctions that might occur and their possible causes.

The figures are at the back of this installation manual, in the appendix.

Fully and carefully read and use this installation manual, before installing the appliance. When using the DRU Powervent system® or DRU CM system®, the accompanying installation manual should also be read completely and carefully, before installation work is started.

!Tip

The following symbols are used in the manuals to indicate important information:

Work to be performed

!Caution

Suggestions and recommendations

!Caution

You will need these instructions to prevent problems that might occur during installation and/or use.

You need these instructions to prevent fire, personal injury or other serious damages.

After final delivery, the manuals should be handed over to the user.

## 2. CE declaration

We hereby declare that the design and construction of DRU's gas-fired heating appliance comply with the essential requirements of the Gas Appliance Directive.

Product:	gas-fired heating appliance
Type:	Metro 200XT RCH / Metro 200XT Tunnel RCH
EEC directives:	2009/142/EC; 2006/95/EC; 2004/108/EC
Standards:	NEN-EN-613; NEN-EN-613/A1; EN60335-2-102

Internal precautions at the company will guarantee that appliances produced in series comply with the essential requirements of the EC directives in force and the standards derived from them. This declaration will lose its validity if adjustments are made to the appliance without prior written permission by DRU.

A copy of the test certificate can be downloaded via [www.druservice.com](http://www.druservice.com).

### 3. SAFETY

#### 3.1 General

- !Caution**
- Observe the generally applicable regulations and precautions/safety instructions in this manual.
  - First check – in appendix 2, table 2 – whether the appliance to be installed has the correct technical version.
  - Read the manual carefully to ensure a proper and safe installation of the appliance.
  - Observe the regulations/instructions in this manual.

#### 3.2 Regulations

Please install the appliance in accordance with the applicable national, local and constructional (installation) regulations.

#### 3.3 Precautions / safety instructions at installation

Carefully observe the following precautions/safety regulations:

- The appliance may only be installed and maintained by recognised installers who are skilled in the field of gas heating and electricity.
- Do not make any changes to the appliance.
- When installing a built-in appliance:
  - Use non combustible and heat-resistant materials for the chimney breast, including the top of the chimney breast, the material in the chimney breast and the back wall against which the appliance will be placed. For this you can use both sheet material and stone-like materials.
  - Take sufficient measures to prevent temperature of a wall behind the chimney breast becoming too high, including the materials and/or objects behind the wall.
  - Comply with the minimum required internal sizes of the chimney breast.
  - Vent the chimney breast by means of ventilation holes with a combined passage as stated further down in the text.
  - Use heat-resistant electrical wiring.
  - Place heat-resistant electrical wiring away from the appliance and as low as possible in the chimney breast. This has to do with the temperature development in the chimney breast.
- Only use the flue gas discharge / combustion air supply system supplied by DRU.
- When installing a free-standing appliance: place the appliance away from the back wall by the minimum distance stated further down in the text.
- Do not cover the appliance and/or do not wrap it in an insulation blanket or any other material.
- Keep combustible objects and/or materials outside the appliance's radiation range. This radiation range is 500 mm, unless stated otherwise.
- Only use the accompanying set, such as the wood or pebble set, and place it exactly as described.
- Leave space around the ionisation pin and spark electrode and never place glow material around these pins.
- Make sure there is no dirt in gas pipes and connections.
- Place a gas tap in accordance with applicable regulations.
- Prior to putting into operation, check the complete installation for gastightness.
- Prevent blocking of the explosion hatch(es) at the top and/or bottom of the appliance and check whether it/they connect(s) properly to the sealing surface before the appliance is built in.
- Do not ignite the appliance before the gas, discharge and electric connections have been fully installed, first observe the procedure described in chapter 7.3.
- Do not use the appliance when a pane is broken and/or cracked, until it has been replaced.

- !Caution** In case of broken or torn glass panes, the appliance may not be used.

### 3.4 Principle of ignition cycle

Below you will find a brief description of how this appliance is ignited. The receiver in the appliance will get a signal from the remote control to start the ignition process. The receiver will get the signal to start the ignition process. This signal is passed on to the burner device, after which, if applicable, the relay for the Powervent System® is switched. After an 8 second interval, the ignition on the spark electrodes will start. If no Powervent System® is connected, only the relay will switch and the ignition will start immediately. The main burner will be ignited at about 50% of its capacity. This will prevent a larger amount of gas in the combustion chamber, if no ignition takes place. When the gas ignites, ionization will have to be detected. In order to make sure the flame has passed over, this will take place at the other side of the burner. When ionization is detected, the gas control will modulate to 100%.

In case of an appliance with a switchable second burner, the second valve is switched (you will be able to hear a 'click') in order to ignite the second burner. After ignition of the second burner, the appliance will always go to the full position (full capacity). This will guarantee that the second burner will actually ignite. The second burner can be switched on and off manually, by means of the remote control. In case of switching on manually, the appliance will first return to full load.

**!Caution** The appliance's control unit is characterized by stringent safety requirements. It is possible that the burning appliance switches off automatically and then switches back on again. This is not a failure, but a check. The moment the appliance's control unit is connected to mains voltage, the control unit will perform this check every 24 hours. If the appliance is burning at that time, the appliance will extinguish and then start again immediately.  
If you wish to prevent this, you can remove the plug and insert it again at a time during the 24 hours when the appliance is never or hardly ever burning.

## 4. Removing the packaging

Note the following items when removing the packaging:

- Remove all packaging materials.
- Remove all supplied components in, on and/or at the appliance.
- Check the appliance and accessories for damages (during transport).
- If necessary, contact your supplier.
- Never install if an appliance is damaged!
- Remove any screws that are used to fix the appliance to a platform or pallet.

**!Caution** Glass is a ceramic material. Very small irregularities in the glass panes cannot be avoided, but are within the required quality standards.

**!Caution** Keep plastic bags away from children.

- Appendix 2, table 1 indicates which components should be available after unpackaging.
- Contact the supplier if you find that not all components have been supplied.
- Packaging must be disposed of in accordance with the regulations.

## 5. Installation

### 5.1 Type of gas

The data plate indicates for which type of gas, gas pressure and for which country this appliance is intended. The data plate can be found on the appliance or can be attached to a chain to which it should remain attached.

**!Caution** Check whether the appliance is suitable for the type of gas and gas pressure used at the location.

#### 5.1.1 Reconstruction to different type of gas

In order to convert this appliance to a different type of gas, please contact DRU's service department and ask for the possibilities.

### 5.2 Gas connection

Place a gas tap in the gas pipe in accordance with the applicable regulations.

The gas connection on the gas control is located next to the receiver (see Appendix 3, fig. 38 (G)).

**!Caution** Make sure there is no dirt in gas pipes and connections.

The following requirements apply to the gas connection:

- Use a gas pipe with the correct dimensions, so that no pressure loss can occur.
- The gas tap must be approved (in the EU this will be the CE mark).
- You should always be able to reach the gas tap.

### 5.3 Electric connection

In case of a 230 Volt electrical connection, provide proper grounding. Place this electrical connection away from the appliance, as low as possible in the chimney breast. This has to do with the temperature development in the chimney breast.

- !Caution**
- Protect the gas control and electric components, hereafter referred to as the gas control, against building dust and moisture!
  - For connecting the receiver and control panel at an appliance equipped with the CM system®, you must observe the instructions in the supplied manual.

#### 5.3.1 Connecting the switch contact (if applicable)

It is possible to operate one or more lamps (in case of several lamps, a maximum of 8A/250VAC/30VDC) via the remote control of the appliance. You could think of the lamps of Dru's lux elements. For this, you can use switch contact B on the receiver (see appendix 3, fig 36). The switch contact is not polar sensitive.

#### 5.3.2 Connecting the Dru Omivent (if applicable)

If the appliance is equipped with a Dru Lux Omivent system, it can be operated with the remote control and connected (see appendix 3, fig 36, (C)). The supply to this connection is equal to the mains voltage.

### 5.4 Placing the appliance

- !Caution**
- Place the appliance in front of a heat-resistant and non combustible wall. The wall brackets on a built-in appliance ensure that the minimum distance to the wall is maintained.
  - Ensure there are no combustible objects or materials present in the fire's radiation range, within a distance of 500 mm, unless indicated otherwise.
  - Place the concentric system in such a way that no fire hazard is ever created (also see section 5.8).
  - Take sufficient measures to prevent temperature of a wall behind the chimney breast becoming too high, including the materials and/or objects behind the wall.
  - Do not cover the appliance and/or do not wrap it in an insulation blanket or any other material.
  - Make sure that the appliance to be installed has a stable position. Fasten possible extending legs with the self-tapping screws.

- !Caution** When installing a built-in appliance, always take the following into account:
- The minimum construction measurements according to Appendix 3, Fig. 1 and 2.
  - The construction height of the appliance.

- Provide a gas connection at the location. For details, see section 5.2.
- Make a passage for the concentric system; for details, see section 5.8.3.

**!Caution** Additional instructions for the appliance to be installed can be found from section 5.10.

### 5.5 Placing a built-in appliance (if applicable)

Not all built in DRU appliances are supplied with a control hatch.

**!Caution** Built in appliances must be installed with the DRU control hatch. This is necessary to ensure a durable, safe and proper operation. The DRU control hatch can be ordered separately. Exceptions are:  
Appliances with supplied DRU guard cabinet. The DRU guard cabinet is intended for installation with a suspended platform. If the appliance will be connected to the DRU PowerVent system, the DRU control hatch has to be used after all.

The gas control is mounted to the appliance. It must be taken out and placed in the control hatch at a later time. For placing the gas control in the control hatch, see section 5.7.

Proceed as follows:

- Loosen the bracket with the gas control by loosening the self-tapping screws and screw the self-tapping screws back in the appliance.
- Place the bracket with gas control, together with the wiring of the ignition/ionisation cable(s), the flexible gas hose(s) and type plate with chain in the direction of the control hatch.

**!Caution** The data plate should remain connected to the chain.

- Set the height of the appliance using the adjustable feet.
- Make the appliance level at the same time.

**!Tip** The construction frame can be adjusted afterwards for most 2- or 3 sided appliances. This allows a good contact of the construction frame with the chimney breast. Adjustment should take place before the appliance is built in. After building in, adjustment is no longer possible. For 2- or 3-sided appliances that cannot be adjusted, we refer to section 5.10 'Additional instructions'.

**!Caution** Do not ignite the appliance before the gas, discharge and electric connections have been fully installed, first observe the procedure described in chapter 7.3.

### 5.6 Placing the chimney breast (if applicable)

For a good heat discharge and operation of the appliance, there should be sufficient space around the appliance. The chimney breast should be ventilated sufficiently by means of ventilation holes (incoming and outgoing).

**!Caution** When an appliance is built in the floor, please take into account the minimum distances from a combustible floor. If applicable, additional information about this is provided from section 5.10 'Additional instructions'.

- !Caution**
- Use non combustible and heat-resistant materials for the chimney breast including the top of the chimney breast, the material in the chimney breast and the back wall of the chimney breast.
  - The appliance is not a support structure. Make sure the appliance does not have to bear the weight of the chimney breast for example.
  - The passage of the ventilation holes (outgoing), which are placed as high as possible, is stated in Appendix 2, Table 2.
  - If no control hatch is placed in the chimney breast, an air supply of at least 80 cm<sup>2</sup> should be attached as low as possible. If there is, the control hatch will suffice as air supply.

- !Caution** When placing the chimney breast, you should take the following into account (see Appendix 3, Fig. 2):
- The location for the control hatch: this must be placed as low as possible.
  - The dimensions of the control hatch; see Placing the control hatch section 5.7.
  - The location of the ventilation holes (V) (outgoing).
  - Maintain a minimum 30 cm distance between the top of the ventilation hole (outgoing) and the ceiling of the house.
  - The measurements of the glass pane, so that it can be placed/removed after placing the chimney breast.
  - The protection of the gas control and the pipes against cement and plaster.
  - If possible, you should place decorative strips, frames, etc., after any required structural work has been completed. Prevent the use of painter's tape. If this is not possible: use a good quality painter's tape and remove it immediately after plastering or painting work.

- !Tip** You should preferably apply the ventilation holes (outgoing) on both sides of the chimney breast. Use the DRU ventilation elements.

Check the following issues, before the chimney breast is fully closed:

- Whether the discharge / concentric system is placed correctly.
- Whether the channels, fixing brackets and possible clip bindings, which cannot be reached after installation, are fastened by means of self-tapping screws.

- Do not plaster on or over the edges of the construction frame, because:
- The heat of the appliance could cause cracks.
  - It will no longer be possible to remove/place the glass pane.
- When using stone-like materials and/or plaster finishing, allow the chimney breast to dry for at least six weeks prior to taking the appliance into operation in order to prevent cracks.

### 5.7 Placing the control hatch (if applicable)

The control hatch (also see paragraphs 5.5 and 5.6) is placed as low as possible in the chimney breast.

- !Caution**
- The bottom of the control hatch may not be placed higher in the appliance than the burner surface.
  - Place control hatch and bracket with gas control indoors in a dry place only!

A number of components are placed in the control hatch, such as data plate, gas control and, if applicable, the components belonging to the DRU Powervent System®.

Place the control hatch as follows, see Appendix 3, Fig. 3 for details:

- Make an opening in the chimney breast, as described in the manual for the control hatch.

- !Tip** The opening in the chimney breast may be made horizontal and vertical.

- Place the inner frame (A); unscrew bolts (D and F) for this.

- !Caution** The inner frame should be placed in the correct way. Two positions are possible. Placing the inner frame with a rotation of 180° is not allowed (see Appendix 3, fig. 4).

- !Tip**
- When the chimney breast is made of bricks, the inner frame can be built with bricks at the same time.
  - In case of a different material, the inner frame can be glued or fastened with four countersunk screws.

- Remove the bracket with the gas control (B) from the appliance and place these self-tapping screws back in the appliance.

- Attach the bracket with gas control to the inner frame (A). Proceed as follows:
  - Unwind the cables. This will, amongst other things, prevent a poor operation of the ignition.
  - Unwind the flexible gas pipe(s).
  - Mount the bracket with the gas control to the inner frame (A). The slotted hole falls in allen screw (C); the hole at the bottom falls over the head of allen screw (D).
  - Fix the bracket with allen screw (C).

- !Caution**
- Avoid kinks in the pipes.
  - Do not lay the cables of the ionisation and ignition pins along metal parts, wiring and other components.

- Connect the gas pipe with gas tap (see section 5.2).
- Bleed the gas pipe.

**!Tip** If the gas tap is closed, the bracket with gas control can be easily removed by loosening the clamp coupling under the gas control and loosening the allen screw (C) by a few turns. The bracket with the gas control can now be lifted and removed towards the front out of the control hatch.

- Connect the 230 V mains voltage with earth connection. Various types of plug connections are supplied. The type of plug depends on the country where the appliance is placed.
- Place the data plate in its intended clamp (G).
- Mount the outer frame with door (E) to the inner frame using two allen screws (D and F).

**!Tip** The outer frame can be placed in such a way that the door turns to the left or right.

**!Caution** Always close the control hatch with the lock (H) because of the electricity behind the door (230V). You can operate the lock with a fitting flat object.

## 5.8 Concentric system

### 5.8.1 General

The appliance is connected to a flue gas discharge / combustion air supply system delivered by DRU, hereafter referred to as the concentric system. The diameter for this connection is indicated in appendix 2, table 2. The passage to the outside can be created with a wall terminal (C11) or a roof terminal (C31). If necessary, an existing chimney can be used (see section 5.8.4).

- !Caution**
- Only use the concentric system supplied by DRU. This system has been tested in combination with the appliance. DRU cannot guarantee a proper and safe operation of other systems and does not accept any responsibility or liability for this.
  - Use a chimney set for the connection to the chimney, DRU will be able to supply it.
  - DRU's concentric system is intended for indoor use and may therefore not be used outdoors, with the exception of the sections intended for that purpose such as roof and wall terminals.

The concentric system is constructed from (the flue spigot of) the appliance.

If, due to constructional circumstances, the concentric system is placed first, it is possible to connect the appliance by means of a telescopic pipe piece.

### 5.8.2 Construction of the concentric system

Depending on the configuration of the concentric system, the appliance must be further adjusted with a possible restrictor slide and/or air inlet guide.

See Tables 4 and 6 for determining the correct adjustment and section 'Adjustment of the appliance' for the method of working.

The concentric system with wall or roof terminal has to comply with the following conditions:

- In appendix 2, table 4 or 5 you can find whether a concentric pipe should be connected and what the minimum vertical length would have to be.
- Determine the permissibility of the required configuration.

When using a **wall terminal (C11)** the following applies:

- The total vertical pipe length, when using a wall terminal, may have a maximum length that can be found in appendix 2, table 4.
- The minimum vertical pipe length, when using a wall terminal, can be found in appendix 2, table 4.
- The total horizontal pipe length, when using a wall terminal, may have a maximum length that can be found in appendix 2, table 4 (excluding wall terminal; see appendix 3, fig. 5).

When using a **roof terminal (C31)** the following applies:

- The construction of the chosen system, when using a roof terminal, must be permissible according to Appendix 2, Table 5 (See the method of working described below).

The working method below indicates how the permissibility is determined of a concentric system when using a roof terminal.

- 1) Count the number of 45° and 90° bends required (15° and 30° bends are also allowed).
- 2) Count the total number of whole metres of horizontal pipe length.
- 3) Count the total number of metres of vertical and/or sloping pipe length (roof terminal excluded).
- 4) In the first 2 columns of Table 5, look for the number of bends required and the total horizontal pipe length.
- 5) In the top row of Table 5, look for the required total vertical and/or sloping pipe length.
- 6) A box with a letter means that the chosen concentric system is permitted.
- 7) Use Table 6 to determine how the appliance should be adjusted.

### 5.8.3 Placing the concentric system

- !Caution**
- Maintain a distance of at least 50 mm between the outside of the concentric system and the walls and/or the ceiling (see section 5.4). If the system is built in (for instance) a cove, it should be made with non combustible, heat-resistant material all around it.
  - Use heat-resistant insulation material when passing through combustible material.
  - Create a terminal for the concentric system with the following diameters:
    - The pipe diameter +25 mm for a passage through non combustible material (see Appendix 3, fig. 40).
    - The pipe diameter +200 mm for a passage through combustible material. Insulate the surrounding free space with at least 60 mm mineral wool (see Appendix 3, fig. 41).
  - The rosette of the wall terminal is too small to seal the opening in case of passage through combustible material. That is why a heat-resistant intermediate plate of sufficient size should first be mounted to the wall. Then, the rosette is mounted on the intermediate sheet.

The roof terminal can end in a sloping and a flat roof.

The roof terminal can be supplied with an adhesive plate for a flat roof or with a universally adjustable tile for a sloping roof.

- !Caution** Some heat-resistant insulation materials contain volatile components that will spread an unpleasant smell for a prolonged time; these are not suitable.

Place the concentric system as follows:

- Build the system up from (the flue spigot of) the appliance.
- Connect the concentric pipe pieces and, if necessary, the bend(s).
- On each connection, apply a clip binding with silicon sealing ring.
- Use a self-tapping screw to fix the clip binding to the pipe on locations that cannot be reached after installation.
- Apply sufficient wall brackets, so that the weight of the pipes does not rest on the appliance.
- Determine the remaining length for the wall or roof terminal and cut it to size, make sure the correct insertion length is maintained.
- Place the wall terminal with the (groove/folded) seam at the top.
- Attach the wall terminal from the outside by means of four screws.

- !Caution** When using the wall terminal, place the terminal with a downward slope of 1 cm / metre towards the outside, in order to prevent rain water from raining in.

### 5.9 Connection to an existing chimney (C91)

The appliance can be connected to an existing chimney. A 100 mm diameter flexible SS pipe is placed in the chimney for discharging flue gases. The surrounding space is used as combustion air supply.

In case of an appliance connection of ø200/130, 0.8 metres of concentric system must first be connected vertically. Reduce the concentric system after the first 0.8 metres to a diameter of 150/100. The concentric system of 150/100 can be vertically connected to an existing chimney.

The following requirements apply when connecting to an existing chimney:

- Only allowed when used in combination with the special DRU chimney set. The installation regulation is part of the delivery.
- The internal size should be at least 150 x 150 mm.
- The vertical length has a maximum of 12 meters.
- The total horizontal pipe length may have a maximum length that can be found in appendix 2, table 4.
- The existing chimney should be clean.
- The existing chimney should be tight.

For setting the appliance, the same conditions/instructions apply as for the concentric system described above.

## 5.10 Additional instructions

- !Caution**
  - Use the correct tools in order to move the appliance. This in relation to its weight (+/-270kg).
  - In case of the Tunnel version of this appliance, it is important to know that the tilting mechanism of the glass pane is only located on one side of the appliance. First establish on which side of the appliance the tilting mechanism is placed.
- !Caution** Keep combustible objects and/or materials outside the appliance's radiation range. This radiation range is 1000mm (see Annex 3 Fig. 2).
- !Tip** Extension legs are available for this appliance.
- Attach the appliance to the wall using the wall brackets that may be pre-mounted on the appliance (B) (see appendix 3, fig.1).

## 5.11 Construction frame

The construction frame of of this appliance can be adapted from the "4S setting" to the "3S setting" (see appendix 3, fig. 2 and 6). The 3S setting allows the bottom side of the pane to connect to the floor or the platform.

- !Caution** When using the 3S construction frame, observe a minimum distance of 450 mm from combustible floor covering or other materials (see the red-shaded area in appendix 3, fig. 2 (3S)).
- !Caution** We are unable to provide further information on, or assume responsibility for the way in which floor covering or other materials are affected by use of the fire (e.g. how a wooden floor may 'work'). Regardless of whether the minimum required distances from combustible floor covering or other materials are observed.

If the 3S setting is selected, the lower strip must be removed before the appliance is installed.

- Proceed as follows (see appendix 3, fig. 6):
- Unscrew the Allen screws (M) using a 2 mm Allen key.
- Hold the strip (N) and unscrew the self-tapping screws (O).
- Remove the strip.

## 5.12 Glass pane

The glass pane is mounted in a steel frame. Only in case of a crack or break, it will be necessary to replace the glass pane in the steel frame. When the glass pane is referred to in this document, this will include the steel frame.

- !Caution**
- Avoid damaging the glass panes when removing/placing them.
  - Avoid/remove fingerprints on the glass panes, as they will burn into the glass.
  - The glass pane must be removed/placed by two persons.

### 5.12.1 Removing the glass pane

When removing the glass pane, please observe the following steps (see appendix 3, fig. 7a, 7b and 8):

- Loosen the bolt (T) in the lock bracket (U) by 3 turns (see appendix 3, fig. 7a (1)).
- Turn the lock bracket (U) to the left by a quarter turn. This will unlock the handle (X), by means of which the glass pane can be opened.

**!Caution** Always prevent the glass pane from falling forwards!

- Pull the lever (X) down, using your index fingers. Press down the glass pane while the lever (X) is moved to the right 180° and hold on to the glass pane! This will prevent the glass pane from falling forwards and getting damaged (see appendix 3, fig. 7a (2 and 3)).
- Carefully pull the glass pane towards the front with the two handles located at the left and right top side of the glass pane frame and then allow the glass pane to drop (see appendix 3, fig. 7b).

- !Caution**
- The following actions should be performed by 2 persons.
  - Prevent stresses on the glass pane by performing the following actions simultaneously on the left and right side.

- Carefully remove the glass pane with 2 persons from the lower glass pane guides at both sides of the appliance (see appendix 3, fig. 8).

### 5.12.2 Placing the glass pane

The glass pane is fitted by using the above procedure in reverse order (see appendix 3, fig. 7a, 7b and 8).

- !Caution**
- Avoid/remove fingerprints on the glass pane, as they will burn into the glass.
  - Ensure that the groove (D) in which the glass pane will be placed is free from, for example, chips, vermiculite, pebbles, self-tapping screws or other objects that could damage the glass pane when closing the appliance.

Pay attention to the following when fitting the glass window:

**!Caution** Make sure the cams at the bottom on both sides of the glass pane frame are correctly placed in the guides at the bottom of the combustion chamber by 2 persons (see appendix 3, fig. 8)!

**!Caution** Check whether the 4 "clips" (C) are still properly attached around the bottom of the glass pane before the glass pane is closed, in order to prevent it from getting damaged.

**!Caution** First press the glass pane in its place at the upper corners and then hold the glass pane with 1 hand before sliding the handle to the left again. Otherwise, the projections will not fall over the glass pane, as a result which it will not close properly.

- Turn the lock bracket (U) back to its position and re-tighten the bolt (T).

## 5.13 Adjustment of the appliance

The appliance does not have to be set in order to combine it with the used discharge system. Some configurations of discharge systems that can be used have been established. These configurations of discharge systems for use with wall terminal and roof terminal are stated in appendix 2, tables 4, 5 and 6.

## 5.14 Placing the wood, pebble and broken glass sets

The appliance is supplied with a wood, pebble or broken glass set.

The vermiculite that is used to fill the burner is black in case of the wood and broken glass sets. In the case of the pebble set, the vermiculite has a natural colour.

**!Caution** The figures do not always show the correct colours.

**!Caution** Strictly observe the following instructions to prevent unsafe situations.

➤ Only use the supplied wood, pebble or broken glass set.

➤ Only use the glow material (see appendix 3, fig. 15) in combination with the wood set.

➤ Place the wood, pebble or broken glass set exactly as described.

**!Caution** Placement of the pebble set and broken glass set requires exactly the same actions. The figures only show the pebble set.

➤ Make sure the ionization and ignition electrodes and the surrounding space remain free (see appendix 3, fig. 9 to 12).

➤ Make sure that the slot between the burner and the vermiculite tray is kept free.

➤ Make sure there is no vermiculite dust on the burner.

### 5.14.1 Wood set

The wood set consists of vermiculite (see appendix 3, fig. 13), chips (see appendix 3, fig. 14), glow material (see appendix 3, fig. 15), ash (see appendix 3, fig. 16), a vermiculite plate consisting of 4 sections (see appendix 3, fig. 18a) and a number of logs (see appendix 3, fig. 17).

**!Caution** Colours may differ from photograph.

➤ Place the vermiculite plate (consisting of 4 sections) in the appliance, as indicated (see appendix 3, fig. 18b). Plate numbers 1, 2, 3 and 4 are intended for the Metro 200XT FRONT and plate numbers 1, 2, 5 and 6 for the Metro 200XT TUNNEL.

➤ Fill the burner with vermiculite; evenly spread the vermiculite (see appendix 3, fig. 18).

The vermiculite may not get higher than the edge of the burner.

**!Tip** You can influence the flame picture by moving the vermiculite,

**!Caution** The burner deck has to remain covered with vermiculite in order to prevent reduction of the burner's life span.

➤ Identify logs A to L (see appendix 3, fig. 17).

**!Tip** Use the burn stains on the logs for identification.

➤ Place logs A to L. Use the position brackets for this (see appendix 3, fig. 19 to 27).

**!Caution** The logs may not completely cover the burner pattern, as:

- The main burner will not ignite properly;
- this may lead to unsafe situations;
- the appliance will become filthy more quickly, as a result of soot;
- the flame image will be affected.

➤ Fill the vermiculite tray with chips; spread the chips evenly (see appendix 3, fig. 27).

➤ If required, spread the glow material over the burner.

**!Caution** The areas around the ionization and ignition should remain free from glow material. The glow material can also affect the flame image.

**!Tip** • Fasten the glow material under the chips and/or wood set.

- It is possible to remove the 2 racks below the pane frame. These are intended for the pebble set, but may remain in order to place chips in the panel frame as well (see appendix 3, fig. 28). If you wish to remove them, loosen the nuts (W) and remove the racks (V).

### 5.14.2 Pebble set and broken glass set

The pebble and broken glass sets consist of vermiculite (see appendix 3, fig. 13), a vermiculite plate consisting of 4 sections (see appendix 3, fig 29) and pebbles or broken glass.

- !Caution**
- Placement of the pebble set and broken glass set requires exactly the same actions.
  - The colours may differ from the photograph.
- Place the vermiculite plate (consisting of 4 sections) in the appliance, as indicated (see appendix 3, fig. 29). Plate numbers 1,2,3 and 4 are intended for the Metro 200XT FRONT and plate numbers 1,2,5 and 6 for the Metro 200XT TUNNEL.
- Fill the burner with vermiculite; evenly spread the vermiculite (see appendix 3, fig. 18b).
- !Tip** You can influence the flame picture by moving the vermiculite,
- !Caution** The burner deck has to remain covered with vermiculite in order to prevent reduction of the burner's life span.
- Fill the burner and the vermiculite tray with pebbles or broken glass.
- Spread the pebbles or broken glass evenly over one layer (see appendix 3, fig. 30).
- Carefully distribute the pebbles or the broken glass over the lower strip (Q) of the glass pane (see appendix 3, fig. 30).
- !Caution** Ensure that the groove (D) in which the glass pane will be placed is free from, for example, chips, vermiculite, pebbles, self-tapping screws or other objects that could damage the glass pane when closing the appliance.
- !Caution** Incorrect placement of the pebbles or broken glass, e.g. on top of each other, could have the following consequences:
- The main burner does not ignite properly, which could result in unsafe situations.
  - The flame image will be affected.

## 6. Control

The appliance is supplied with a wireless black remote control for the user (see appendix 3, fig. 35 (B)). As an option, an orange remote control can be supplied for the installer (see appendix 3, fig. 35 (O)). Controlling the flame height, igniting and switching off take place through the black remote control controlling the receiver. Some fires can also be controlled in an alternative way. These options are described further down in this chapter.

The user manual describes the operation of the appliance, including the operation of the remote control and alternative methods of operation.

- !Caution**
- Do not ignite the appliance before the gas, discharge and electric connections have been fully installed, first observe the procedure described in chapter 7.3.
  - Chapter 6 of the manual supplied applies to an appliance equipped with the CM system.

### 6.1 Remote controls

#### 6.1.1 Black remote control for the user

Proceed as follows to make the black remote control ready for use:

- Place the two penlite batteries (AA) in the battery holder of the remote control.
- Make sure the voltage of the atmospheric fire is not switched off for longer than 5 minutes.
- If the remote control does not have the "BND" state, the following operations must be performed: Press the menu button (button with square symbol) on the remote control for at least 10 seconds and then press a few times until "BND" appears on the screen with the receiving symbol.
- Press the "arrow up" and "arrow down" buttons briefly and simultaneously, so that a (flashing) warning triangle and an hourglass appear in the screen as well.
- As soon as logging on is finished, the start screen will appear

**!Tip** All functions are extensively explained in the supplied user manual.

#### 6.1.2 Orange remote control for the installer

By means of the optionally available orange remote control, it is possible to read all information stored in the receiver. In this way, the last 20 error messages can be retrieved, and it will also be possible to read how many times an error occurred. Moreover, this remote control can also be used to adjust the basic settings and to read the size of the ionization flow. It is also required for a wired Domotics control.

### 6.2 Alternative control (if applicable)

In addition to the remote control, it is also possible to operate the fire in alternative ways. For this purpose, a Domotics system can be connected to the receiver. This can be a wired or a wireless system. The various possibilities are described below (see appendix 3, fig. 35, 36 and 37).

#### 6.2.1 Wired

Wired connection of the Domotics system to the receiver takes place via a 0-3VDC direct current (see appendix 3, fig. 36 (D)).

**!Caution** A higher voltage than 3V will damage the receiver and is therefore not permitted.

**Tip!** In case of Domotics systems with an output voltage of 0-10V, you should switch the voltage back to 0-3VDC. Use a voltage distributor made of resistors. For example, 2200 ohms and 680 ohms. The voltage above 680 ohms resistance can be used on the input of the 0-3VDC. Low ohmic resistors must be used.

By controlling the height of the voltage, the receiver will be able to calculate the position of the fire. Table "B1" in appendix 3, fig. 37 shows the relationship between the voltage and the height of the flame. If you have an appliance with 2 burners, table "B2" will apply. It shows the relationship between the voltage, the height of the flame and the number of burners.

- Proceed as follows when connecting the Domotics system to the receiver:
- Connect the 0-3VDC signal to the connector, to which a black and yellow wire are connected (see appendix 3, fig. 36 (D)).
- Use the orange remote control to select the option for a wired connection: go to position 8 in the first menu and select an appliance with single burner (option 2) or an appliance with two burners (option 3). For this, read the manual of the orange remote control.

**!Caution** The yellow wire is the + pole, the black wire is the - pole. Always connect '-' to '-' and '+' to '+'.

### 6.2.2 Wireless

The wireless connection is divided into 2 types:

- Connection via a 'modbus' protocol.
- Control via an application.

**!Caution** Only 1 type of wireless connection is possible on the communication module.

#### 6.2.2.1 Connection via 'modbus' protocol

Wireless connection of a Domotics system to the receiver is possible via a connection according to the 'modbus' protocol. Such a connection can only be established with a communication module (see Appendix 3, fig. 35 (W)). This module can be ordered from DRU. This communication module translates the 'modbus' protocol from the Domotics system into a wireless signal to the receiver.

When connecting a Domotics system via the communication module to the receiver, proceed as follows:

- Use the remote control to test whether the location where the communication module will be placed is within the reach of the receiver.
- Place the remote control on this location and test the reception sensitivity (RSSI).
- Press the on/off button and down arrow at the same time. The value that is now visible, must be between -20 and -70 (see User Manual, "Reception Sensitivity"). If needed, hold the remote control closer to the appliance in order to improve the reception.
- Connect the communication module by means of an RJ45 plug, according to the instructions in the manual that is supplied with this module.
- Now follow the steps described in the 'modbus' protocol manual. It is available from the supplier of the domotics system.

#### 6.2.2.2 Control via application

Also when operating the appliance via a tablet provided with the DRU Control App (iOS or Android), you will need a communication module. This module can be ordered from DRU.

In order to control the fire via an application, proceed as follows:

- Using the remote control, test whether the location where you want to place the communication module is within the receiver's range.
- Place the remote control on this location and test the reception sensitivity (RSSI).
- Press the on/off button and down arrow at the same time. The value that is now visible, must be between -20 and -70 (see User Manual, "Reception Sensitivity"). If needed, hold the remote control closer to the appliance in order to improve the reception.
- Connect the communication module by means of an RJ45 plug, according to the instructions in the manual that is supplied with the communication module.
- Use the instructions for the application in order to install it.

**!Caution**

- The DRU Control app functions in accordance with the multicast and communication protocol. Ensure the router is equipped with this. For this, consult the router's installation manual.
- If the DRU Control app is used, the thermostat function no longer applies.

The application 'DRU Control' is available in the AppStore, at GooglePlay or our website: [www.drufire.co.uk](http://www.drufire.co.uk)

## 7. Final inspection

In order to check whether the appliance is working properly and safely, you must perform the following inspections before the appliance is put into operation.

### 7.1 Gastightness

**!Caution** All connections must be gastight. Check the connections for gastightness. The gas control may be subjected to a maximum pressure of 50 mbar.

### 7.2 Gas pressure/line-pressure

The burner pressure is set at the factory; see data plate.

**!Caution** The line-pressure in house installations must be checked, because it can be wrong.

- Check the line-pressure; see Appendix 3, Fig 38 (P1) for the measuring nipple on the gas control.
  - Contact the gas company if the line-pressure is too high.
  - If the line-pressure is too low, check this at the gas meter. Contact the gas company if the line-pressure is also too low at the gas meter.

### 7.3 Ignition main burner

For igniting the main burner, see the User Manual.

#### 7.3.1 First ignition of the appliance after installation or adjustments.

**!Caution** After installation, or after work has been performed, you should ignite the appliance for the first time without the glass window. If necessary, bleed the gas pipe.

Follow the procedure described below:

- If necessary, remove the glass pane.
  - Start the ignition procedure as described in the user manual.
  - If the main burner does not ignite:
    - Reset the system by pressing the buttons 'arrow up' and 'arrow down' simultaneously.
    - Repeat the ignition procedure until the main burner ignites;
- !Caution** After each attempt to ignite, the system should be reset by means of the remote control.
- Consult the diagram with error messages (Appendix 1) if this does not succeed after a few attempts;
- The appliance ignites at 50%. After ionization has been detected, the appliance will modulate to 100%. This detection will have to take place within 15 seconds, or else the appliance will enter error mode. If applicable, the second valve will switch to ignite the second burner. Here, you can hear a clear 'click' sound.
- Check whether the main burner continues to burn.
  - If the main burner does not continue to burn:
 

Reset the system as described and repeat the ignition procedure until the main burner continuous to burn.
- !Caution** The system can be reset and re-ignited three times in a row at maximum. Then the system will enter a hard lock-out and you will have to wait half an hour, before you can make a new attempt.
- Consult the malfunction search diagram (Appendix 1) if this does not happen after a few attempts.
  - Switch off the appliance.
  - Then mount the glass window as described from chapter 5.10.
  - Repeat the ignition procedure a few times and perform the checks described in chapter 7.3.2.
  - From now on, the main burner should ignite smoothly.
  - Clean the glass pane after igniting for the first time (see section 8).

**!Tip** When checking whether the main burner continuous to burn, it is possible that it switches off after 15 seconds. In that case, this will be caused by the fact that there is no ionization detection and because the glass window has not been placed. This can be regarded as a situation where the main burner continues to burn.

- !Caution**
- Always wait 5 minutes before re-igniting the appliance.
  - No changes may be made to the gas control.

### 7.3.2 Main burner

- !Caution**
- The ignition electrode should ignite the main burner within a couple of seconds and without popping.
  - The main burner(s) must cross the full burner smoothly and without popping and continue to burn.
  - If the appliance does not ignite after three restarts and enters hard lockout, it may never be reset by disconnecting it from the power supply. If a restart is necessary after all: remove the glass pane and make sure the gas is able to escape from the appliance. After this, the appliance may be disconnected from the power supply for 10 seconds. After these 10 sec., the power supply may be reconnected. Ignite the appliance in the same way as the first ignition, as indicated in section 7.3.1.

- Check operation of the main burner from a cold condition.
- If sparks are determined between the ignition electrodes, the main burner should burn within a few seconds.

**!Tip** The flame picture and a good flame transfer can only be properly judged if the glass window is installed.

Use the malfunction search diagram (Appendix 1) if the ignition of the main burner does not comply with the above-mentioned requirements.

### 7.4 Flame picture

The flame picture can only really be assessed when the appliance has been burning for several hours. Volatile components from paint, materials, etc., which evaporate in the first hours, will affect the flame picture.

- Check whether the flame picture is acceptable.
- Consult the malfunction search diagram (Appendix 1) if the flame picture is not acceptable, in order to solve the problem.

## 8. Maintenance

Once per year, the appliance must be checked, cleaned and, if necessary, repaired by a competent installer in the field of gas heating and electricity. Check at least whether the appliance is working properly and safely.

- !Caution**
- Close the gas tap when performing maintenance work.
  - Check the gastightness after repair.
  - Make sure there is no voltage on the appliance.

- Clean glass pane(s), if necessary.

**!Caution** Only clean a glass pane once it has reached room temperature.

- Caution!**
- Avoid damage to the glass pane(s).
  - Avoid/remove fingerprints on the glass pane(s), as they will burn into the glass.
  - Only clean glass pane(s) with DRU glass pane cleaner, as other agents may damage and/or deteriorate the glass pane(s). For more information, visit our website [www.dru.nl](http://www.dru.nl) or ask your dealer.
  - Only use a microfibre cloth. Other materials such as (kitchen) paper, steel wool, etc. may cause scratches and damage the coating in case of anti-reflective glass pane(s).
  - Regularly remove accumulated dirt, as it can burn into the glass.
  - Do not use the appliance when a pane is broken and/or cracked, until it has been replaced as described from section 5.10.

**!Caution** If necessary, place back the wood or pebble set correctly; for this, see from section 5.10.

- Inspect the flue gas discharge system.

**!Caution** You must always perform a final inspection.

- Perform the inspection as described in chapter 7.

## 8.1 Parts

Components that have to be replaced are available at the supplier.

## 9. Delivery

You must explain to the user how to operate the appliance. You must give him/her instructions on putting it into operation, the safety measures, the operation of the remote control and the annual maintenance (see the User Manual).

- !Caution**
- Tell the user to close the gas tap immediately in case of malfunctions/bad performances and contact the installer in order to prevent dangerous situations.
  - Chapter 9 of the manual supplied applies to an appliance equipped with the CM system.
  - Indicate the location of the gas tap.
  - Point out the precautions in the user manual against unintended ignition by other wireless remote controls such as car keys and garage door openers.
  - Point out the 230 Volt connection.
- Instruct the user about the appliance and the remote control.
- When the appliance is taken into operation, point out that
- In order to avoid cracks in a chimney breast made of stone-like materials or finished with plaster, it should dry for at least 6 weeks prior to putting the appliance into operation.
  - When the appliance is stoked up for the first time, volatile components evaporate from paint, materials, etc.. (Also first read chapter 3 of the user manual !).
  - When evaporating, the appliance should preferably be set at the highest level.
  - The room should be well ventilated.
  - Cleaning the glass pane(s).
- Give the manuals to the user (all manuals should be stored near the appliance).

## 10. Malfunctions

Appendix 1 provides an overview of malfunctions that might occur, their possible causes and remedies.

## Appendix 1 Malfunctions

Error messages			
Error code	Problem	Possible cause	Remedy
F01	Communication loss between receiver and burner device	Communication cable does not make contact	Make sure the connectors of the communication cable make proper contact
		Communication cable defective	Replace communication cable
F02	Receiver overheated (60° above room temperature)	Poor ventilation at receiver	Improve ventilation at receiver
		Receiver makes contact with hot parts	Move receiver in such a way that there is no more contact with hot parts
F03	Internal (receiver) NTC sensor does not work correctly	Receiver is defective	Replace the receiver
F04	External NTC sensor, does not work correctly	External NTC sensor or cabling defective.	Replace NTC sensor or replace cabling
F05	Internal safety error	Receiver is defective	Replace receiver
F06	Communication loss between transmitter and receiver	Transmitter is out of the receiver's range	Make sure the transmitter is near the receiver
		Obstacles between transmitter and receiver may interfere with the signal	Remove possible obstacles between transmitter and receiver
		Transmission power is too weak	Check transmission power (see User Manual chapter 10)
F08	No ionization	No sparks	Make sure distance between electrodes is 3-4 mm
			Replace spark electrodes
		No gas	Check whether there is gas
			When using PowerVent, check whether the gas valve opens
		Poor flame transfer main burner	Check position blocks/chips
			If necessary, remove dust from burner openings
		No good flame under ionization pin (suffocating flame)	Glass pane strips not placed correctly
			Check restriction and air inlet guide setting
			When using PowerVent, check pressure setting
		Ionization pin placed incorrectly	Place it on the right location
		Ionization pin blocked (measure ionization flow when > 0 and < 1.8 uA)	Remove any vermiculite or chips from the burner

Error messages			
Error code	Problem	Possible cause	Remedy
F08 (follow-up)		Ionization pin defective (measure ionization current when 0)	Replace the ionization pin
F12	ESYS is not released	ESYS is in hard-lock	Wait half hour until ESYS resets itself.
F13/F14	(ionisation <0.8 µA) Flame loss when only the main burner (F13) is on or both burners (F14) are on	Ionisation pin short-circuited	Remove chips, vermiculite or glow material lying against the ionisation pin
		Ionisation current too critical ( $0.8 \leq \text{ionisation} < 1.8 \mu\text{A}$ )	Increase ionisation current to $\geq 1.8 \mu\text{A}$ by rearranging vermiculite, and removing chips and dust from the burner openings
		Suffocation due to poor flue gas channel	Check the concentric system
			Check the setting of the appliance
		Suffocation when using PowerVent	Check the pressure setting of the PowerVent system
		24 hour check control (only in case of F13)	Reset with remote control (consult Powervent manual)
		Gas has fallen away	Check gas supply
		Gas control defective (see "A" in app. 3, fig. 38)	Replace the gas control
F15	No burner device (see "C" in appendix 3, fig. 38)	Burner device came loose from burner device	Attach the burner device
		Burner device incorrectly mounted	Mount the burner device correctly
		Pins on the connector on the gas control are bent	Bend them straight
	High limit error	High limit bridge defective	Check High limit bridge ESYS
F16	Hardware Error ESYS	ESYS defective (burner device)	Replace ESYS (burner device)
F17	Disable contact is closed	Window is open. (if this contact is present)	Close window
		A bridge has been made across the Disable contact.	Remove bridge on ESYS (burner device)

■ = Situation is not permissible

<sup>1)</sup> minimum length

Table 6: Conditions for the adjustment of the appliance with a roof terminal

G20/G25.3			
Situation	Air inlet guide	Restrictor slide	Distance restrictor. in mm
A	N.A.	N.A.	N.A.

**!Caution** If a roof terminal without bends is used, you must first connect a 0.8 metre concentric pipe with a 200/130 mm diameter vertically to the appliance. After the first 0.8 metre, reduce the diameter to 150/100 mm

**!Caution** If a roof terminal with bends is used, you must first connect a 0.8 metre concentric pipe with a 200/130 mm diameter vertically to the appliance. Make the system with a 200/130 mm diameter, and reduce the diameter to 150/100 mm after the last bend.

The diagram illustrates the system architecture for a smart meter. It shows the following components and their connections:

- (D) House:** Represented by a house icon. It is connected to the modem (R) via a  $0-3\text{ V}$  signal line.
- (W) Router:** A white wireless router. It is connected to the modem (R) via a **Modbus** connection.
- (R) Modem:** A black modem device. It receives the  $0-3\text{ V}$  signal from the house (D) and communicates with the router (W) via Modbus. It also connects to the smart meter (B) and the gas meter (O) via dotted lines.
- (B) Smart Meter:** A black smart meter. It receives data from the modem (R) and communicates with the gas meter (O) via a dotted line.
- (O) Gas Meter:** An orange gas meter. It receives data from the smart meter (B) and communicates with the gas valve actuator via a dotted line.
- Gas Valve Actuator:** A mechanical device used to control the gas valve. It receives data from the gas meter (O) and communicates with the tablet (A) via a dotted line.
- (A) Tablet:** A tablet device. It receives data from the gas valve actuator and communicates with the router (W) via **WiFi**.

The diagram shows a complex network of connections between these components, enabling data exchange and control within the smart meter system.

38C-1871 /0

The image shows a photograph of a 38p-0320 /0 device, which is a small electronic component with a metal housing and a black plastic cover. Four wiring diagrams (A, B, C, D) are overlaid on the image, showing different ways to connect the device to a power source. Diagram A shows a 3-wire connection (L, N, and ground). Diagram B shows a 2-wire connection (L, N). Diagram C shows a 3-wire connection (L, N, and ground) with a different terminal configuration. Diagram D shows a 2-wire connection (L, N) with a variable load (0-3V).
